

CS101 Quiz 4 - Practice - Answers

Covers:

- Anything From **Lab 4-User Input and Type Casting**
- Any word on the CS101 Github ["vocabulary.md"](#) file

```
import java.util.Scanner;
public class quizCode {
    public static void main(String[] args) {
        Scanner input = new Scanner(System.in);
        System.out.print("Enter your age: ");
        int age = input.nextInt();
        System.out.print("You input: " + age);
    }
}
```

1. (2pts) You compile and run the code above. In the console, you type **five** and press Enter. What happens?
A) The value "**five**" is assigned to the variable **age**
B) The value "**5**" is assigned to the variable **age**
C) The value **5** is assigned to the variable **age**
D) The program will raise an Exception
2. (2pts) In Java, which line of code would create a new variable named **scanner** with type **Scanner** that reads input from the terminal?
A) **scanner scanner = new scanner(System.in);**
B) **scanner Scanner = new Scanner(System.in);**
C) **Scanner scanner = new Scanner(System.in);**
D) **Scanner Scanner = new Scanner(System.in);**
3. (2pts) What happens if you compile and run this line of java code? **double myDub = (double) 5 ;**
A) It declares the variable **myDub** with the initialization value of **5**
B) It declares the variable **myDub** with the initialization value of **5.0**
C) It declares the variable **myDub** with the initialization value of "**5.0**" (quotes are part of value)
D) This code has an error and will not compile
4. (2pts) What happens if you compile and run this line of java code? **int myInt = Integer.parseInt("hello");**
A) It declares the variable **myInt** with an initialization value of **hello**
B) It declares the variable **myInt** with an initialization value of "**hello**" (quotes are part of value)
C) It does nothing because **myInt** is not used
D) This code has an error and will not compile
5. (1pts) What is the difference between **System.out.print()** and **System.out.println()**?
A) There is no difference
B) **print()** keeps the cursor on the same line; **println()** moves to a new line
C) **println()** keeps the cursor on the same line; **print()** moves to a new line
D) **print()** only works with integers
6. (1pts) Define: **Java Primitive**
A) A data type that stores a reference to data in memory. Has methods and properties.
B) Converting a value from one data type to another.
C) Defining a variable's name and type, with or without an initial assignment.
D) A built-in data type that stores a simple value directly in memory.
